

Which parameters matter on which page, for which kind of automotive website

Four site types × six key pages = the twenty-four columns an audit actually runs. Every number is computed from the shipped config, not rated by hand.

145

weighted parameters across 8 sections

24

site-type × key-page combinations

12

inventory parameters
renormalised out for servicing sites

4

different scoring models
beneath the 8 sections

Built **6 August 2026** from **Backend/config/parameterImportance.js**, **Backend/config/siteTypeProfiles.js** and the eight metric services · Companion to **Automotive-Site-Type-Parameter-Matrix**, which covers the site-type axis alone

What this report is

The companion report rates every parameter against the four site types the platform audits. It answers *what kind of business is this*. It does not answer the question an audit actually has to resolve first: **this page, on this site — what is even scoreable here, and what is it worth?** A trade-in flow is worth 0.15 of the Conversion section, but only on a trade-in page, and only if the business sells vehicles. Move it one page over and it is worth nothing at all.

So this report crosses the two axes. Four site types, each with a six-page crawl plan, gives twenty-four columns; 145 weighted parameters give the rows. Every cell is that parameter's **share of that page's final score** — not its in-section weight, but what it actually controls once the page tilt, the site profile and the per-parameter importance ratio have all been applied.

Nothing here is a fresh judgement call. The section tilt is read from `singleAuditWorker.js`, the site profile and applicability from `siteTypeProfiles.js`, and the importance ratios from `parameterImportance.js`. The in-section weights and page gates are transcribed from the eight metric services, with the source line printed against each block in the master matrix. If a number here is wrong, the engine is wrong the same way — which is the point of computing it rather than writing it.

§ How a cell is computed

Three multiplications and a renormalisation stand between a parameter and its influence on a score.

1 · PAGE TILT

What kind of page is this? A finance page gives Security 22 of its 100; a booking page gives Conversion 25. Eighteen page types, one row each.

2 · SITE PROFILE

What kind of business runs it? Applied as a *ratio* against the neutral row, so a franchise dealer's finance page keeps its Security tilt and a repair shop's contact page never inherits one.

3 · PARAMETER RATIO

Franchise is the reference column, so a franchise dealer scores exactly as it did before the ratings existed. Every other type moves relative to it.

Then the section renormalises: $\Sigma(\text{score} \times w) / \Sigma(w)$ over the parameters that actually apply. That last step is what makes an N/A parameter harmless — it leaves the denominator instead of entering it as a zero.

Four sections do not use that formula, and it changes how you read their rows.

Technical Performance reports PageSpeed's own Lighthouse category score as its headline — fixed weights (LCP 25, TBT 30, CLS 25, FCP 10, SI 10) that no site profile can move. The twelve-component list, the delivery hygiene checks and *Sold vehicle* feed `Graded_Percentage`, a diagnostic the overall score never reads.

Security / Compliance deducts from 100 rather than averaging, and the site tilt is rescaled to preserve the original weight sum — so a garage's controls redistribute without the section quietly becoming easier.

Accessibility weights by severity (×3 critical, ×2 serious, ×1 moderate) and folds four keyboard checks into one composite with fixed internal weights.

AEO carries three page-gated parameters — FAQ blocks, E-E-A-T and sameAs — that are simply absent elsewhere.

§ The five crawl plans

A full-site run visits at most six pages, each one a full Chromium render plus an eight-pillar pass. The page list is therefore both the biggest lever on cost and — because the page decides what is scoreable at all — the biggest lever on what the report can say. These lists are ordered by what each page uniquely unlocks.

The last row is not a failure mode. A four-page site has three of the six categories and no more; the run reports three and stops. What that costs is quantified in §6.

§ Section share of the page score — all 24 columns

Page tilt × site profile, renormalised to 100. This is the ceiling every parameter underneath it is competing for. Read the spread across a row: Security runs from **5.1** on a repair garage's pricing page to **23.2** on a franchise dealer's finance page — a 4.5× swing driven entirely by what page it is and who runs it.

Four dossiers

Each type's six pages, in plan order: what the page is worth section by section, which parameters carry it, and — the number that decides whether a slot earns its place — which parameters **nothing else in the plan can reach**.

A franchise store is the only one of the four that arrives with borrowed authority — the OEM's locator already resolves it as an entity, its model vocabulary is consistent, and it ranks on brand+geo almost by default. What it does not get for free is scale hygiene: templated titles across thousands of VDPs, faceted SRPs that manufacture duplicates, and the heaviest third-party tag stack in local retail sitting on the same origin as a credit application. Its plan spends four of five slots on the vehicle-sale funnel and the fifth on Reg-Z / Reg-M advertising compliance.

Home → VDP → SRP → Finance → Trade-in → Lease

Slot 6 goes to Lease. A franchise store advertises APR and lease payments, which puts it under Regulation Z and Regulation M — so the lease page carries the disclosure battery that an independent lot does not have to answer for.

135

parameters reachable across the six-page plan

0

structurally absent — this business cannot have them

3

scoreable for this business, but no page in the plan opens the gate

13

measured and shown, but carry no weight in any section

Plan gap — Conv: Appointment Booking, Incentives Displayed · **AEO:** EEAT Composite. Every one of these is unlocked by a single Service or About slot.

Home

Tech 18 · SEO 19 · A11y 9 · Sec 13 · UX 10 · Conv 17 · AIO 7 · AEO 7

The URL the visitor typed, and the only page Stage 1 always audits. Every plan starts here.

HTTPS	1.96%		
Title	1.85%		
Schema Markup	1.66%		
FCP	1.49%		
SI	1.49%		
CTA Presence	1.49%		

Structurally the same funnel as a franchise store, scored differently in two places. Trust has to be manufactured rather than borrowed — **Trust badges**, **Testimonials**, **Vehicle history** and **Click-to-call** all rise a tier, because a shopper cannot fall back on a manufacturer's name. And mixed-brand inventory arriving from several feeds with inconsistent make/model/trim naming is exactly what breaks entity extraction, so **Keywords & entities annotated** rises too. Meanwhile the pure-scale problems relax: with a smaller URL count, index control and crawl depth stop being the binding constraint.

Home → VDP → SRP → Finance → Trade-in → Specials

Slot 6 goes to Specials. An independent lot advertises price and add-ons rather than APR — the FTC CARS Rule's primary target — so the offers page, not a lease page, is where its advertising exposure concentrates.

136

The whole inventory block is gone and the funnel is a scheduler. Twelve parameters are renormalised out of the denominator rather than scored zero — that alone is worth about a section and a half of the score, and getting it wrong is the single largest source of false-low readings in an audit product. What replaces them is discovery: a chain is found branch by branch, so **NAP consistency**, **sameAs breadth** and **Locations** carry weight a dealer's plan never spends. AEO rises to 11 because service queries are questions, and answer engines resolve them directly.

Home → Booking → Services → Pricing → Locations → Content

Slot 5 goes to Locations. A chain is discovered one branch at a time — the locations page is the only page in the plan where sameAs validation is scored for a servicing site.

126	12	0	13

The most differentiated profile in the product: highest AEO weight of the four (13) and the lowest Security (8). Its customer cannot evaluate mechanical competence directly, so accreditation is the currency — **Certifications & awards**, **E-E-A-T** and **Testimonials** all sit at the top tier. Its traffic is phone-dominated and often urgent, which lifts **Target size**, **Meta viewport** and **Click-to-call**. And the absence of a form is frequently the correct design here: the telephone is the funnel, so **Form presence** drops a tier rather than being scored as a miss.

Home → Booking → Services → Pricing → About → Content

Slot 5 goes to About. A single-location garage has no brand badge to borrow and no branch network to enumerate, so it is found on its credentials — technicians, years in trade, ASE / I-CAR / VACC accreditation.

126	12	0	13
parameters reachable across the six-page plan	structurally absent — this business cannot have them	scoreable for this business, but no page in the plan opens the gate	measured and shown, but carry no weight in any section

Structurally absent: SEO: VDP Content Uniqueness, SRP Index Control, SRP To VDP Links · **Sec:** Finance Form Security, Legal Disclaimers · **UX:** Inventory Filtering, No Results UX, Vehicle Image Gallery · **Conv:** Vehicle History, TradeIn Flow, Financing Flow, Finance Calculator

Home

§ The short run: a four-page garage

Home, Services and About exist; Booking, Pricing and Content do not. The run reports 3 / 6 and that is the honest answer. The question worth asking is what the missing three slots would actually have added — and computing it gives a more reassuring result than the headline 3 / 6 suggests.

REACHABLE IN THE SHORT RUN

Home → Services → About

Home carries **Appointment booking** — the gate was widened to home and generic for servicing sites precisely because a garage's booking form usually sits on the home page. Services carries **Pricing transparency**, **Incentives**, **FAQ blocks** and **E-E-A-T**. About carries **sameAs**, **E-E-A-T** and **Form presence**.

WEIGHTED PARAMETERS LOST ENTIRELY

None.

Every weighted parameter the full six-page plan can reach is also reachable from Home, Services and About. The three servicing page gates that matter — booking, pricing/FAQ, and E-E-A-T/sameAs — each open on more than one page type, and the short run holds at least one of each.

The practical read: a short run costs confidence, not coverage. Every parameter still gets a score; what changes is the quality of the evidence behind it and the number of samples the page average is built from. **Pricing transparency** is judged off the services page rather than a dedicated price list. **Appointment booking** is judged off whatever the home page exposes rather than a real scheduler. And the Content page — the highest On-Page SEO and AEO share of any page in any plan, at 19.4 and 15.2 — is simply not there to demonstrate topical authority. That is a narrower and more defensible claim than "3 / 6 of the audit is missing", and it is the one the numbers support.

§ Where the config and the engine disagree

Six things surfaced while computing this matrix from the shipped code. None of them break a score; all of them mean a rating in `parameterImportance.js` is doing less than it reads as doing.

HIGHEST VALUE · 13 RATINGS INERT

Every Technical Performance rating is dead config for the score

The section headline that `OverAll()` consumes is `Percentage`, which is PageSpeed's own Lighthouse category score — fixed weights, computed by Google. The twelve-component list where `importance()` is applied produces `Graded_Percentage`, a diagnostic nothing reads. So *Render blocking* rated Most Important for repair sites, and the *Sold vehicle* site gate, change no score anywhere. Worth either stating that in the file's header or moving the tilt somewhere it lands.

4 RATINGS INERT

The four keyboard sub-checks are rated but never multiplied

Focus order, *Focusable content*, *Tab index* and *Aria hidden focus* are folded into the **Keyboard navigation** composite at fixed weights 8 / 6 / 5 / 3, and `importance()` is not applied inside it. Their ratings — including the deliberate drop to Recommended on repair sites — have nothing to multiply. This contradicts the file's own stated policy of excluding parameters the engine does not weight.

RATED 3 FOR EXACTLY THE TYPES IT IS DISABLED FOR

Content relevance is rated Most Important for service and repair, and switched off

Hidden on 2026-07-07 pending a redesign: `checkContentRelevance` still runs, its 0.06 is commented out of the weights. Its rating is 2233 — the matrix's reasoning being that a garage has to explain a mechanical problem to a non-mechanic before it can sell the fix, while dealer copy is specification data. It is the single highest-value re-enable in the file, and it is worth the most to the two types it currently does nothing for.

PLAN GAP · THE ONE FINDING THAT CHANGES A SCORE

Three parameters are unreachable in the dealer plans, and one of them is rated Most Important there

Both dealer plans spend every slot on the sale funnel, so no `service`, `about` or `content` page is ever fetched. Three gates therefore never open:

E-E-A-T composite	AEO · gate: <code>about / content / service</code>	0.10 in-section — the second-heaviest AEO parameter
Appointment booking	Conversion · gate: <code>service (+ booking/home on servicing sites)</code>	rated Important for franchise
Incentives displayed	Conversion · gate: <code>service / specials</code>	rated Most Important for franchise

The last one is the sharp edge. *Incentives displayed* is rated Most Important for a franchise dealer on the reasoning that OEM incentives are its time-bound offer surface — but the franchise plan's sixth slot goes to Lease, not Specials, so there is no page in the plan where the gate opens. The rating and the crawl plan were derived from the same matrix and still disagree. An independent lot does get Specials, so it scores incentives and misses only the other two.

All three are unlocked by a single Service or About slot. Whether that is worth displacing Lease or Trade-in is a product call, not a correctness one — but it should be made deliberately rather than inherited.

DUPLICATION RISK

Two page-weight tables, two vocabularies, currently identical

`singleAuditWorker.js` keys its table `trade / specials`; `utils/sectionWeights.js` keys the same rows `tradein / offers`, because each matches its own classifier. Every shared row is byte-identical today and both are internally consistent — but they are maintained by hand, and the comment in each says "keep BOTH tables in sync", which is the sort of instruction that is true right up until it isn't.

BELT AND BRACES

The site-level inventory gate is defence in depth, not a live fix, on the worker path

`siteTypeProfiles.js` justifies the site gate with a repair shop's `/finance-options` page classifying as `finance` and running the whole credit-application battery. On the worker path that cannot happen: a servicing site is classified with `classifyServicePageType`, which has no finance bucket, so the page lands in `generic`. The gate is still correct and still worth keeping — any caller that reaches a metric service with the dealer classifier gets the protection — but the specific scenario in the comment is already closed upstream.
