

End-to-End Audit Timing — URL to Finished Report

Every step from the moment a URL is submitted to the completed report. · Target: <https://www.galpinford.com> · Device: **mobile** · Measured 2026-06-16

58 s

TOTAL — URL submitted → report finished

52 s

Parallel metric block (the critical path)

52 s

Slowest lane — Technical Performance (PageSpeed)

13%

Wall-clock saved by running the 6 categories in parallel

1 How a single audit runs

The worker executes these phases in order. Phases 1–5 are sequential; phase 6 fans the six metric categories out in parallel, then phase 7 finalizes.

Why the total isn't the sum. If the six categories ran one-after-another they'd take **60 s** (plus the modeled security lane). Running them together in one **Promise.all** collapses that to **52 s** — the wall-clock equals the **slowest single lane**, which is **Technical Performance** because of its two PageSpeed API calls (~50 s mobile / 75 s desktop). Speeding up the audit means speeding up that one call; nothing else is on the critical path.

2 Step-by-step breakdown

Indented rows (└) are the parallel lanes inside phase 6 — their times overlap, so they don't add to the total.

STEP	STARTS AT	DURATION	% OF TOTAL	WHAT HAPPENS
1 · Website existence gate (fastFetch)	+0.0 s	1.6 s	2.8%	Light axios GET — rejects dead domains before Chromium launches.
2 · Dealership detection (pre-check)	+1.6 s	11 ms	0.0%	Deterministic rule engine over the fetched HTML (cheerio). No network.
3 · Launch Puppeteer + render + bot handling	+1.6 s	1.8 s	3.2%	playwright-extra + stealth: browser launch + homepage render + Cloudflare/CAPTCHA clear.

STEP	STARTS AT	DURATION	% OF TOTAL	WHAT HAPPENS
4 · AIO Readiness	+3.5 s	4 ms	0.0%	14 static checks on the loaded HTML — runs first so guests see AI-readiness instantly.
5 · AEO / GEO	+3.5 s	2.4 s	4.2%	Static signals + a few network signals (llms.txt, robots, Knowledge Graph, shallow crawl).
↳ Conversion & Lead Flow	+5.9 s	143 ms	0.2%	~30 DOM-eval/static checks on the one loaded page.
↳ UX & Content	+5.9 s	149 ms	0.3%	~23 DOM-eval checks on the one loaded page.
↳ Accessibility	+5.9 s	280 ms	0.5%	One axe-core run feeds ~18 checks.
↳ On-Page SEO	+5.9 s	7.1 s	12.2%	Static parse + own HTTP (broken-link, sitemap, EEAT, image HEADs).
↳ Technical Performance	+5.9 s	52 s	89.8%	DOMINATES — 2× PageSpeed API (mobile+desktop) + inventory/service/mobile tabs.
6 · Parallel metric block (wall-clock)	+5.9 s	52 s	89.8%	The 6 categories run together (Promise.all). Wall-clock = the slowest lane.
7 · Score aggregation + finalize	+57.9 s	1 ms	0.0%	Weighted average + grade; result buffered in memory, Mongo write batched async.

Security & Compliance is modeled, not measured. It performs **active** SQLi / XSS injection, admin-path brute-forcing and credential testing — attack traffic that must not be fired at a third-party site. In the real worker it runs inside phase 6 alongside the others; its ~14 s typical (≤30 s worst-case) lane sits well within the PageSpeed-bound window, so it does not extend the total unless its probes time out.

Measured live against <https://www.galpinford.com> (mobile) via the project's own Puppeteer_Cheerio loader and real metric services (Backend/_pipeline_timing.mjs). Sequential phases timed directly; the parallel block reflects the worker's Promise.all. PageSpeed latency varies by site and device (47–75 s observed). Single-instance in-memory batching assumed. Generated 2026-06-16.
